Serving all electricity customers

# LOOK UP, IT COULD SAVE YOUR LIFE

Making contact with overhead electricity wires or even coming close puts you at serious risk of injury or death from electrocution when spreading slurry.

- The majority of accidents occur through failure to notice the overhead power lines and to take sensible precautions.
- Always take sensible precautions when spreading slurry. Remember electricity can jump gaps.
- Be careful spreading slurry as the liquid can travel for up to 100 metres. You could be electrocuted if it hits an overhead electricity wire.
- Overhead power lines can be difficult to see in sunlight or at dusk.
