# **Executive Summary**

In September 2017 the Commission for Regulation of Utilities (CRU), whose mission is to protect public interest in water, energy and energy safety, announced the details of the phased delivery plan for the introduction of smart meters across Ireland. The CRU tasked ESB Networks with the roll-out of the National Smart Metering Programme (NSMP), which involves replacing all existing electricity meters with modern smart meters.

The programme is an important part of the Government's Climate Action Plan<sup>1</sup> and National Energy Security Framework.<sup>2</sup> It is being delivered over a number of phases by ESB Networks in co-operation with the CRU, the Department of the Environment, Climate and Communications, the Sustainable Energy Authority of Ireland and with all electricity supply companies.

The National Smart Metering Programme (NSMP) transforms the energy retail market by empowering customers with better and more accessible information about their energy consumption, and, requiring Suppliers to provide customers with access to new tariffs and services, and more accurate bills.

The NSMP reforms are facilitated by ESB Networks rolling out smart meters and a supporting communications and IT infrastructure. This creates a technical platform for recording, collecting, processing and distributing detailed, accurate data, that allows customers to see their detailed consumption history and automates retail market activities that currently require manual intervention and site visits.

To operate in the retail electricity market, companies must comply with a range of obligations, rules, systems and processes which are captured in legislation, licences, codes and procedures. This regulatory framework is continuously updated and is designed to promote effective competition between Suppliers, promote customer choice based on good quality information and to provide an appropriate framework of customer protection.

The requirements for the NSMP have been transposed by CRU into relevant parts of the regulatory framework. Specifically, the most recent Supplier Handbook<sup>3</sup> and within updates to the Retail Market Systems<sup>4</sup> which were approved by CRU in March 2019 and went live in 2021 with the following data flows available from Smart Meters:

- 24 Hour Cumulative Register Data;
- Interval Data and SST (Standard Smart Tariff) Register Data;
- Instrumentation Data, and
- Event Data.

ESB Networks is committed to ensuring that the National Smart Metering Programme is delivered in compliance with applicable data privacy laws and that all customer data is safe and secure. Pursuant

\_

 $<sup>^{\</sup>rm 5}$  REGULATION (EU) 2016/679 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

# The National Smart Metering Programme (NSMP)

### Introduction

This overview document and the accompanying DPIA were first published in September 2020. ESB Networks will issue updates to these documents to ensure that data subjects are kept informed about any data processing changes which may occur as the planned additional NSMP services are delivered over the remaining phases of the NSMP. These changes are aligned to the supporting legal frameworks that mandate the NSMP activities and provide the legitimate basis for the processing of the necessary customer information. The NSMP remains committed to protecting the rights and freedoms of individuals and is committed to keeping stakeholders informed when changes occur.

### Background

In September 2017 the Commission for Regulation of Utilities (CRU), whose mission is to protect public interest in water, energy and energy safety, announced the details of the phased delivery plan for the introduction of smart meters across Ireland. The CRU tasked ESB Networks with the roll-out of the National Smart Metering Programme (NSMP), which involves replacing all existing electricity meters with modern smart meters.

Based on the CRU cost benefit analysis<sup>6</sup> and information from Customer Behaviour Trials, the upgrade to smart meters will provide customers with better information to enable them to reduce their energy usage, carbon footprint and, over time, eliminate the need for estimated bills. Smart meters will enable the move to a low-carbon electricity network, the development of smart grids, facilitate local renewable generation and microgeneration and support the electrification of heat and transport.

The CRU's decision to implement smart metering for all residential and smaller business customers was initially announced in July 2012. This decision was made following comprehensive customer behaviour and technology trials and cost-benefit analyses, and in the context of the European Third Package Directive provisions for the rollout of smart meters in Member States to at least 80% of electricity consumers by 2020 if there is a positive cost benefit analysis.

The CRU concluded the High Level Design for the NSMP in October 2014 and finalised the suite of detailed policy decisions required to give practical effect to that High Level Design in 2016.

The NSMP has been further underpinned with National Legislation enacted in 2014 (SI.426/2014<sup>7</sup>) and 2022 (SI.37/2022<sup>8</sup>). These, amongst other things, set new functions for CRU in relation to smart metering and set new obligations on electricity suppliers and ESB Networks to support their delivery and implementation.

The rollout of smart electricity meters in Ireland for all residential and small & medium sized businesses commenced in September 2019.

### **Industry Overview**

<sup>&</sup>lt;sup>6</sup> https://www.cru.ie/wp-content/uploads/2017/11/CRU17324-Smart-Meter-Upgrade-Cost-Benefit-Analysis-Information-Paper.pdf

<sup>&</sup>lt;sup>7</sup> https://www.irishstatutebook.ie/2014/en/si/0426.html

<sup>8</sup> https://www.irishstatutebook.ie/2022/en/si/0037.html

The regulatory framework for the retail electricity market in Ireland has developed incrementally since 1999 when the process of market deregulation commenced. It is a model based on a high standard of consumer protection, whilst facilitating efficient competition in the retail markets.

All customers have the right to choose their electricity supplier, and to switch supplier in order to get a better deal. This choice across competing suppliers has delivered significant benefits for customers, including access to new suppliers, a variety of prices and products and by enabling new types of services to enter the market.

The Electricity Regulation Act 1999 (as amended), network operator licences, energy supplier licences, industry codes, including the Meter Code and the Supplier Handbook largely set out the rules and legal obligations which underpin the day to day operation of the electricity retail market.

These rules and obligations are delivered through complex and secure IT Systems and Processes operated and maintained by ESB Networks on behalf of the whole industry. Operating & maintaining these systems and processes are requirements of ESB Networks Distribution System Operator (DSO) Licence, where Condition 8 requires ESB Networks to operate and maintain a Meter Point Registration Service and Condition 9 requires it to provide Metering & Data Services.

The suite of regulatory documents, market systems and processes provide a clear framework for how ESB Networks should operate in an efficient and non-discriminatory manner, and how energy supply companies should interact with various customer segments in offering products and services.

Since 26th February 2021, customers with a smart meter can avail of new products and services from electricity supply companies. Further information regarding smart meters can be found <a href="here">here</a>.

The NSMP will continue to transform the energy retail markets by empowering customers with better and more accessible information about their energy consumption, and, requiring Suppliers to provide customers with access to new tariffs and services, and more accurate bills.

The NSMP reforms are facilitated by ESB Networks rolling out smart meters, and a supporting communications infrastructure, to all domestic and smaller business customers. This creates a technical platform for collecting detailed, accurate data, and for automating activities that currently require manual intervention and site visits.

The new technical platform and the associated changes to how retail markets operate is fundamentally changing the services that customers, who have a smart meter receive in a number of ways:

- it makes more information available to customers on how they are using energy, allowing them to better decide how much energy to use, when to use it and to select a price plan that suits their lifestyle
- it makes accurate billing of Time-of-Use Tariffs available to all. Currently, access to tariffs
  which allow customers to use energy at cheaper times (off-peak) requires the installation of a
  special meter, and is limited to a relatively small number of customers with Day/Night
  Metering
- it removes the technical requirement for a site visit in order to read a meter as the data will be collected remotely, this will in turn remove the need to provide estimates and make bills more accurate

- it improves the accuracy and timeliness of key retail market processes such as change of supplier (COS) and change of legal entity (COLE)
- it has facilitated the introduction of a Microgeneration support scheme as set out in the Climate Action Plan<sup>1</sup>

The new platform will also improve the quality of existing services. For example, in most cases an actual meter reading will be available to calculate a customer bill (including for a closing bill when a customer changes Supplier or moves home). Hence, the risk of a customer being surprised by a high bill as a result of previous bills being based on estimates (or overpaying due to an inaccurate estimate that is not corrected until a later billing cycle) should be virtually removed.

The new platform will also create opportunities to improve the quality of network services, and to monitor performance in respect of those services more accurately. It does this by providing instrumentation and event data related to the performance and integrity of the local network and the meter assets.

### **Smart Metering Operational Structures**

The first phase of the NSMP culminated in the Smart Metering services activation in February 2021 and the release of the Electricity market functionality (commonly referred to as Market Schema v13). The operational smart metering systems are operated by the Smart Metering Operations Centre (SMOC), an integrated function that manages smart metering systems, applications and data for ESB Networks.

## **SMP Data Protection Impact Assessments**

### **Legal Basis**

The recording, collection and processing of data from smart meters by ESB Networks is necessary to meet a number of legislative obligations set out in SI.37 of 2022 including,

 making validated historical consumption data easily and securely available and visualised to final customers

ESB Networks also has obligations in its DSO Licence under Condition 7 (Detection and Prevention of Theft of Electricity), Condition 8 (Meter Point Registration Service and Meter Registration Agreement) and Condition 9 (Provision of Metering and Data Services). In July 2020, CRU determined, pursuant to Condition 9(2) of the DSO Licence, that the following actions also fall under the scope of Condition 9:

- Programming all smart metering systems installed by it to record (import and export) (i) half-hourly interval data (ii) twenty-four hour, day, day peak and night register readings (iii) instrumentation data and (iv) meter event data from such systems
- The foregoing data should, subject to further direction, be processed by ESB Networks solely for purposes of:
  - continuing to implement the High-Level Design to meet the requirements of the Programme and the emerging obligations from the Clean Energy Package (CEP), in accordance with the Decision and Condition 9 of the DSO Licence;
  - establishing and commissioning the Advanced Meter Infrastructure (AMI) to support operation of the Programme; and
  - Operating the AMI to enable delivery of the Retail Market Smart Services (including time of use tariffs) as described in the electricity retail market processes as updated per schema Version 13

Billing data from smart meters is stored for 7 years by ESB Networks as required by the Metering Code for the Single Electricity Market<sup>9</sup> (Section: 4.2.3) and in accordance with the Statute of Limitations Act 1957, Section 11. A data retention schedule is included in the DPIA for each of the data elements.

### **NSMP Data Flows**

NSMP policy and the obligations arising have been transposed by CRU into the most recent Supplier Handbook<sup>10</sup> and approved within updates to the Retail Market Systems<sup>11</sup> that went live in February 2021.

The Supplier Handbook places obligations on Supplier to make available a Standard Smart Tariff and up to three other Time-of-Use tariffs. Suppliers also have obligations to prepare a Code of Practice for Smart Services and to take meaningful and effective steps to migrate relevant customers to an appropriate Time-of-Use tariff.

<sup>&</sup>lt;sup>9</sup> metering-code-for-the-single-electricity-market.pdf (esbnetworks.ie)

<sup>&</sup>lt;sup>10</sup> <u>Microsoft Word - CRU Suppliers' Handbook 2022 Tracked Change Version 17.06.2022</u>

<sup>11</sup> https://rmdservice.com/v13-00-00-release/

The Retail Market System changes set out the various data flows and market messages maintained by ESB Networks that will facilitate Suppliers as they meet their Supplier Handbook obligations.

As a multiyear programme, reliant on a national regulatory framework that is developing in alignment with the NSMP objectives, ESB Networks will continuously review the NSMP Data Protection Impact Assessments (DPIAs). The DPIAs assess the data collection and processing requirements associated with the NSMP, evaluate risks to the privacy of customers and identify whether these risks can be mitigated to an acceptable level.

ESB Networks has identified four data flows arising from the implementation of the NSMP (for further information see Appendix 1). These are:

- 24 Hour Cumulative Register Data;
- Interval Data and Standard Smart Tarif Register Data;
- Instrumentation Data, and
- Event Data.

### **Securing Customer Data**

ESB Networks is committed to ensuring that the National Smart Metering Programme is delivered in compliance with applicable data privacy laws and that all ESB Networks customer data is safe and secure. ESB Networks access to smart meter data is tightly controlled and multiple layers of cyber security are employed on ESB Networks' IT systems and business processes. The smart meters being deployed have been independently tested from a cyber security perspective and ESB Networks' Retail Market Systems are also subject to regular independent testing and review.

### Conclusion & Further Information

The CRU has tasked ESB Networks with the roll-out of the National Smart Metering Programme (NSMP), which is transforming the energy retail market by providing customers with better and more accessible information about their energy consumption, and, ensuring Suppliers provide customers with access to new tariffs and services, and more accurate bills.

These reforms are facilitated by ESB Networks rolling out smart meters and a supporting communications infrastructure, to all domestic and smaller business customers. This creates a technical platform for recording, collecting, processing and distributing detailed, accurate data, and for automating retail market activities that currently require manual intervention and site visits.

Further information on the NSMP can be found at www.esbnetworks.ie/smartmeter

# Appendix 1: NSMP Data Flow Description

Four NSMP data flows have been identified: Instrumentation Data, Event Data, 24 Hour Cumulative Register Data and Interval & Standard Smart Tariff (SST) Register Data. These are described in the table below.

Data Flow	Description
Instrumentation Data	The Electricity Smart Meter (ESM) has the capability to provide diagnostic metrics relating to power quality on the network in the vicinity of the ESM. These metrics will allow ESB Networks to remotely assess customer supply issues (such as low voltage) which often currently require the visit of a Network Technician and the temporary installation of additional on-site metering.
Event Data	The ESM has the capability to provide ESB Networks with meter event and diagnostic metrics. These metrics provide a range of information related to the network and meter itself which can indicate a safety issue, an operational issue, a tampering or cyber security event.
24 Hr Cumulative Register Data	24-hour Cumulative Registers are identical to the data recorded by existing electricity meters. The registers are called cumulative registers because they increment continuously as energy is consumed (import register) or produced (export register) at a premises. The registers measure energy in kWh <sup>12</sup> (for active energy) and kVARh <sup>13</sup> (for reactive energy).
Interval & SST Register Data	Interval and Standard Smart Tariff (SST) Register data is more granular than the 24-hour Cumulative Register data discussed above and is the new type of data being recorded with the introduction of ESMs.  The Interval Data is recorded on the meter every 30-minutes. These recordings are not cumulative recordings – they are recordings of the energy used, measured in in kW or kVAR, during the 30-minute period. Like the 24-hour registers, the SST registers are Cumulative Registers, but instead of recording continuously they only record during certain times of the day. ESMs are pre-configured to record the SST time settings as defined by the CRU <sup>14</sup> .

<sup>&</sup>lt;sup>12</sup> kWh = Kilowatt Hour

<sup>&</sup>lt;sup>13</sup> kVARh = KiloVAR Hour
